These are actual photographs taken in the same park district, on the same day. One is a photograph of a pool treated with Liquid Bleach; the other treated with Pulsar Plus Briquettes.

Which pool would you rather swim in? Undoubtedly, the one treated with Pulsar Plus Briquettes. That's because you can always count on Pulsar Plus to provide clean, crystal clear and sparkling water that's free from germs, bacteria and algae. This is achieved with consistent and effective chlorination through Pulsar's advanced patented feeding technology and Pulsar Plus Briquettes.

Liquid bleach pools can look like the one above because of inconsistent chlorination and excess TDS. Liquid bleach water is unstable, rarely consistent in its dosing, causing peaks and valleys in chlorination, often referred to as spikes. Additionally, it contributes excess amounts of TDS which leads to corrosion and cloudy water.

Why take a chance on your water quality? Choose the consistent performer. Pulsar Systems deliver 100% sparkling crystal clear water.
